

Comparing three prediction settings

900 predictions · 25 per case and setting · dots: selected by confidence · ticks: best candidate

Best candidate = highest DockQ in the batch, identified using the reference. Connecting lines are not error bars.
Shaded rows include additional assembly components and were not used to choose settings for receptor-nanobody pairs.
Acceptable: DockQ ≥ 0.23. The two AGTR1 rows belong to the same pair; CASR is exploratory.
